Ms. Mary Most Vanek
Public Employees Retirement Association of Minnesota
60 Empire Drive, Suite 200
St. Paul, Minnesota 55103-2088

Dear Ms. Most Vanek:

We are pleased to submit this report on the actuarial experience of the Public Employees Retirement Association of Minnesota for the period July 1, 2000 through June 30, 2004. This investigation is the basis for our discussion on the proposed recommendations discovered through our analysis of the difference between actual and assumed experience. In addition, we recommend a broader, more comprehensive study on the economic assumptions.

All current actuarial assumptions and methods were reviewed as part of this study. Some of our proposed recommendations reflect changes to the assumptions and methods used in the July 1, 2004 actuarial valuation while other current assumptions and methods remain unchanged.

Our analysis was conducted in accordance with generally accepted actuarial principles as prescribed by the Actuarial Standards Board (ASB) and the American Academy of Actuaries. Additionally, the development of all assumptions contained herein are in accordance with the ASB Actuarial Standard of Practice (ASOP) No. 27 (*Selection of Economic Assumptions for Measuring Pension Obligations*) and ASOP No. 35 (*Selection of Demographic and Other Non-Economic Assumptions for Measuring Pension Obligations*).

This study has found two areas of concern which require further discussions and analysis under a broader study. One of our findings was on the method for amortizing the Unfunded Accrued Liability. We believe that the method currently employed may create unstable contribution rates. A separate study should review all available methods and select an amortization method that best matches the long term nature of the stable benefit promise with a long term stable contribution rate.

Secondly, the economic assumptions reviewed here (investment return, inflation, salary increases, and payroll growth) have been reviewed in an aggregate context, as is the prescribed method for experience studies. However, the structure of the Fund may be exposing the Fund to risks that need to be more fully assessed with the cooperative efforts of PERA, SBI and all related parties. There are demographic risks that may be emerging in light of the "split" of the fund between retirees and actives, as well as other possible economic risks more fully explained later in this report.

Thus, we recommend an “amortization method” study and an “economic forecast” study to be conducted before final recommendations can be issued on the matter of changing economic assumptions.

Demographic assumption changes, where applicable, are not a part of these future study recommendations, hence proposed recommendations and changes relating to demographics are presented in this report.

The undersigned actuaries are experienced with performing experience studies for large public-sector pension plans and are qualified to render the opinions contained in this report.

Sincerely,

Leslie L. Thompson, FSA, MAAA, EA
Senior Vice President and Actuary

Brad Ramirez, ASA, MAAA
Actuarial Associate

I. INTRODUCTION AND SUMMARY OF KEY FINDINGS

Actuarial valuations are prepared annually to determine whether the statutory contribution rates are sufficient to fund the Public Employees Retirement Fund on an actuarial reserve basis. Each actuarial valuation involves a projection of the benefits expected to be paid in the future to all members of the Fund. The projection of expected future benefit payments is based on the characteristics of members as of the valuation date, the benefit provisions in effect on that date and assumptions of future events and conditions.

The assumptions used in actuarial valuations can be grouped in two categories: (1) economic assumptions - the assumed long-term rates of investment return, salary increases and payroll growth, and (2) non-economic or demographic assumptions - the assumed rates of withdrawal, disability, retirement, and mortality. Demographic assumptions are selected primarily on the basis of recent experience, while economic assumptions rely more on a long-term perspective of expected future trends.

If actual experience exactly matches the expected experience, the actual annual cost of the Fund will equal the annual cost determined by the actuarial valuation. However, this result is virtually never achieved, due to the long-term forecast of the benefit projections and the numerous assumptions used in actuarial valuations. The Fund recognizes actuarial gains or actuarial losses each year, reflecting the net difference between actual experience and anticipated experience. Determination of the funded status is updated in connection with each actuarial valuation to reflect the net gain or loss. A pattern of gains or losses to one or more assumptions is the basis for interim changes to the assumptions. Each valuation measures the effectiveness of each assumption and allows for the monitoring of the assumptions.

We are providing to the Association proposed recommendations of the assumptions and methods used in the actuarial valuation. If the assumptions on an overall basis prove to be a good indicator of actual experience, the contribution rates for the current level of benefits will continue to be sufficient to meet the funding policy of the Fund. On the other hand, if the assumptions understate or overstate the actual cost to the Fund, the annual contribution rates will vary accordingly.

I. INTRODUCTION AND SUMMARY OF KEY FINDINGS (continued)

Actuarial experience studies are undertaken periodically and serve as the basis for recommended changes in actuarial assumptions and methods. A change in assumptions is recommended when it is demonstrated that the current assumptions do not accurately reflect the current trend determined from analysis of the data or anticipated future trends based upon reasonable expectations. The data analyzed is actual experience for demographic assumptions and economic forecast for economic assumptions. The Actuarial Standards Board (ASB) provides actuaries with standards of practice that provides guidance and recommendations on acceptable methods and techniques to be used in developing both economic and demographic assumptions. Specifically, these are the ASB Actuarial Standard of Practice (ASOP) No. 27 (*Selection of Economic Assumptions for Measuring Pension Obligations*) and ASOP No. 35 (*Selection of Demographic and Other Non-Economic Assumptions for Measuring Pension Obligations*).

A change in actuarial methodology is recommended when such change adds stability to the actuarial valuation process or provides an approach that better fits the funding policy. The methods considered in this study include the actuarial cost method, the actuarial asset valuation method, and the amortization method.

This study reviews the actuarial experience of the Public Employees Retirement Fund for the four-year period from July 1, 2000 through June 30, 2004, compares this experience to the current actuarial assumptions and recommends proposed changes to the assumptions as necessary. The actuarial methods used in performing the valuation are also reviewed in this study and proposed recommended changes are provided as necessary.

I. INTRODUCTION AND SUMMARY OF KEY FINDINGS (continued)

We recommend the following proposed changes to the actuarial assumptions or methods:

ECONOMIC ASSUMPTIONS

We conducted a review of all economic assumptions, including investment return, inflation, salary increases and payroll growth. While the short term four-year history does portray a story of lower salary increases and lower investment returns, we are not yet in a position to recommend a change without further analysis. The reason for these concerns that reach beyond an experience study are:

- The internal transfer of assets to the post fund creates a possible exposure to demographic risk that can only be more fully assessed through a projection study. This generally is not an issue in plans where all assets remain aggregated and payable to all members. But with the Association and this design for the post fund, we recommend a further study of this demographic impact on the long term capital market expectations.
- We are recommending a change in the asset accounting method for the Post-Retirement Fund. We have come to understand through various discussions that all parties are aware of the anomalous form of accounting for the Post-Retirement Fund and how it may not pass the GASB requirement that assets must be “market-related”. (The method employed here has a portion of the assets as “liability-related”.) We would suggest that this is a higher priority for the Association to review. If accepted, we will assess the impact on the fund. Similar to the comments above, once the full impact of this accounting change is understood, SBI needs to be consulted for their assessment of any impact on the asset allocation and related long term capital market assumptions.
- Additionally, we recommend a more comprehensive study between the Association and SBI on the long term capital market assumptions. This is for two reasons: One, we found that the SBI assumptions are

on the optimistic side of average (and the Association should review the related risk so they can assess their long term optimal assumption for funding). Secondly, there have been recent, perhaps fundamental, changes in our economy that merit consideration of all parties (e.g., fuel prices, inflation).

In conclusion, this experience study presents the measurement of experience against assumptions, makes certain recommendations for change, but strongly recommends a more comprehensive study of the additional risks discussed above.

We recommend a review of these assumptions in their entirety, using the “building block” approach to ensure consistency between salaries, inflation and real rates of return. (See Actuarial Standard of Practice #27.)

Inflation

The current inflation assumption is 4.00%-4.50% per annum. We recognize that SBI assumes 3.00% and historical inflation has been lower. However, this assumption requires further study and modeling in light of the unique risks referenced above.

Salary Increase

The current salary increase is calculated using the reported salary for prior fiscal year, with new hires annualized, increased according to the ultimate table shown in the rate table to current fiscal year and annually for each future year. During a ten-year select period, $0.30\% \times (10-T)$ where T is completed years of service is added to the ultimate rate. When comparing experience against the assumptions we found that the select period of ten years may be too long, and that the assumed salary increases are higher than those actually paid during the study period. This assumption also merits further study in light of the risks referenced above.

Payroll Growth

The payroll growth assumption is 6.00% per annum and is higher than overall experience. We recommend that during the course of the broader study that this assumption be reviewed.

I. INTRODUCTION AND SUMMARY OF KEY FINDINGS (continued)

DEMOGRAPHIC ASSUMPTIONS

Withdrawal Rates Current withdrawal rates are based on the age and service of the member. During the three-year select period, the rates are 40% for the first year, 15% for the second year, and 10% for the third year. We recommend keeping the current select period assumptions.

Disability Incidence Rates Disability incidence rates are currently age related, ending at age 64 to 65. We recommend keeping the current assumptions.

Retirement Rates Rule of 90 vs. Non-Rule of 90. The study indicates that actual retirement rates are slightly lower than the current assumed rates. We recommend lowering Rule of 90 retirement rates for ages 55 to 61 and ages 63 - 64. We also recommend lowering the rates for all other retirements for ages 61 and slightly increasing for age 62.

Post-Retirement Mortality We recommend continued use of the current mortality table, the 1983 Group Annuity Mortality Table set back one year for males and set back one year for females.

Pre-Retirement Mortality We recommend the continued use of the current mortality table, the 1983 Group Annuity Mortality Table set back eight years for males and set back seven years for females.

Disabled Mortality We recommend no change to the current tables.

II. ECONOMIC ASSUMPTIONS

The economic assumptions have a significant impact on the development of plan liabilities. Changes to these assumptions can substantially alter the results determined by the actuary. The goal of our analysis is to produce a consistent set of economic assumptions that appropriately reflect expected future economic trends.

The primary economic assumptions that affect the Fund's funding are:

- Investment return
- Salary increases
- Payroll growth
- Inflation

The current economic assumptions used for the July 1, 2004 actuarial valuation for the Public Employees Retirement Association are as follows:

Investment return	-	Pre-retirement: 8.50% per annum Post-retirement: 6.00% per annum
Salary increases	-	Reported salary for prior fiscal year, with new hires annualized, increased according to the ultimate table shown in the rate table to current fiscal year and annually for each future year. During a ten-year select period, $0.30\% \times (10-T)$ where T is completed years of service is added to the ultimate rate.
Payroll growth	-	6.00% per annum

The Actuarial Standards Board (ASB) has adopted Actuarial Standard of Practice No. 27 (ASOP 27), (Selection of Economic Assumptions for Measuring Pension Obligations) to provide actuaries guidance in developing economic assumptions. A key feature of the ASB's guidance is the "building block" approach in developing economic assumptions. This approach requires the actuary to consider the key component parts of major assumptions and determine reasonable best estimates for each component.

Under this approach, we consider the investment rate of return assumption as the combination of an inflation component and a real rate of return component. The components of the salary increase assumption are inflation, productivity and merit. The inflation component is included in all economic assumptions, and therefore is key to developing a consistent set of actuarial assumptions. For this

reason we recommend that the comprehensive study look at long term inflation and its impact on the real and nominal rates of return, as well as the salary and payroll growth assumptions.

II. ECONOMIC ASSUMPTIONS (continued)

A. Inflation

In reviewing the assumed inflation component, we reviewed a commonly referenced historical measure of inflation, the Minneapolis-St. Paul, MN-WI and National Consumer Price Index for all urban consumers (CPI-U). The table below shows how recent inflation experience is well below the longer-term average rate.

Average Annual Change in CPI-U

	Minneapolis - St. Paul	National
Past 5 Years	2.94%	2.68%
Past 10 Years	2.73%	2.52%
Past 20 Years	3.06%	3.07%

The average annual rate of increase in the CPI-U over the five years ending June 30, 2004 is 2.94%. Historical trend is a less important consideration for the assumed rate of inflation, but assists in determining the reasonable bounds of expected inflation.

The typical range of expected inflation for actuarial assumptions in recent years is between 3.00% and 4.50%. The Minnesota State Board of Investment has determined that 3.00% is the best estimate for inflation, and we concur that this estimate is reasonable.

As a check of the validity of this reasonable range, we reference the *2004 Annual Report of the Board of Trustees of the Federal Old-Age and Survivors Insurance and Disability Insurance Trust Funds (2004 OASDI Trustees Report)*. The range of inflation rates in this report was 1.80% for low-cost projection and 3.80% for high-cost projection.

The current inflation assumption is 4.00%-4.50% per annum. We recommend that this be reviewed in the broader study to take into account risk factors such as recent economic developments, changing work force demographics, as well as using the past as a marker for reasonableness.

II. ECONOMIC ASSUMPTIONS (continued)

B. Investment Rate of Return

The investment rate of return assumption is developed using the “building block” approach as outlined in the ASOP 27. Under this approach, the investment rate of return assumption is made up of two components, the inflation component and the real investment rate of return component.

In developing the reasonable range for the real rate of return, we considered the historical returns of the Fund’s two major asset classes, stocks and bonds. First, over the long term, U.S. Stocks (S&P 500) have averaged an annual rate of return of 10.20%, while U.S. Bonds have averaged a 5.70% annual rate of return according to Ibbotson Associates historical market data. Then we used the real rates as developed by SBI, and added the inflation component to develop the range.

The expected real rates of return as supplied by SBI are:

<u>Asset Class</u>	<u>Real Return</u>
Equity	
Domestic	6.25
International - unhedged	6.25
International - hedged	6.05
Emerging markets	8.50
Alternative Assets	
Private equity	10.00
Real assets	5.00
Yield oriented	5.50
Fixed Income	
Domestic bonds	3.50
Non dollar bonds - unhedged	3.50
Non dollar bonds - hedged	3.30
High Yield	4.50
Cash equivalents	1.00

Based on the Fund’s current target allocation and total return assumptions, the expected real rate of return is 5.62% as developed on the next page.

II. ECONOMIC ASSUMPTIONS (continued)

B. Investment Rate of Return (continued)

ASSET CLASS	TARGET ALLOCATION* (A)	EXPECTED REAL RATE OF RETURN** (B)	CONTRIBUTION TO TOTAL REAL RATE OF RETURN (A)*(B)
Domestic and International Equity:	60%	6.25%	3.75%
Bonds:	24%	3.50%	0.84%
Alternative Assets:	15%	6.80% ***	1.02%
Cash:	1%	1.00%	0.01%
Total Expected Real Rate of Return:			5.62%
Assumed Rate of Inflation (using a range of conservative to SBI estimate):			2.50% - 3.00%
Expected Investment Return:			8.12% - 8.62%
Allowance for Investment Expense:			.20%
Range Estimate for Investment Rate of Return Assumption:			7.92% - 8.42%

*Based on Investment Policy and Guidelines

**Based on 3.00% Assumed Rate of Inflation and the real returns and inflation rate provided by the Minnesota State Board of Investment

***Average of the returns of the three asset classes within alternative investments

These real rates of return and rates of inflation have been developed without further modeling of demographic risks to the plan (that may or may not play a role in changing asset allocations or return assumptions). This range development should be viewed as only a single point in the more broad study of long term economic forecasts.

The current assumption is 8.50%, which is slightly above the range developed for this assumption. The 8.50% appears optimistic, and we recommend a comprehensive review of all investment assumptions in the aggregate. Also, we recommend a more comprehensive study with SBI that could include a review of these real rate of return estimates in light of the very recent impacts in our economy.

A similar analysis of the Post-Retirement Fund also yields an expected net investment return range of 7.92% to 8.42% (the target allocation for the Post-Retirement Fund is nearly identical to the target allocation for the Basic Fund). The payment of earnings on retired reserves in excess of 6.00% is accounted for by a post-retirement rate of return assumption of 6.00%. In other words, the liabilities for

retired members are valued at 6.00% (not the assumed 8.50%) to “pay” for cost of living increases. With advancing baby boomer retirements, the economic forecast study will need to examine the impacts on the post as well as the active fund.

II. ECONOMIC ASSUMPTIONS (continued)

C. Salary Increase Assumption

Under the “building block” approach recommended in the ASOP 27, this assumption is composed of three components: inflation, productivity, and merit/promotion. The inflation and productivity components are combined to produce the assumed rate of wage inflation. This rate represents the “across the board” average annual increase in salaries shown in the experience data. The merit component includes the additional increases in salary due to performance, seniority, promotions, etc.

This component is typically more correlated to years of service than age, especially at lower years of service. Thus, we recommend the continued use of a select and ultimate salary scale. The current annual salary increase assumption for selected ages at the ultimate rate is as follows:

Age	Rate
20	6.40%
25	6.40%
30	6.20%
35	6.00%
40	5.80%
45	5.60%
50	5.40%
55	5.20%
60	5.00%
65	5.00%
70	5.00%

During the first ten years of employment referred to as the select period, an amount equal to

- $0.30\% \times (10 - T)$, where T is completed years of service is added to the ultimate rate.

The determination of the reasonable range for the productivity component considers the historical experience of the workforce, as well as national indicators of productivity growth.

II. ECONOMIC ASSUMPTIONS (continued)

C. Salary Increase Assumption (continued)

Below is a summary of the observed and assumed average annual salary increase during the ten-year select period.

	1	2
Age Group	Observed Average Annual Increase	Assumed Average Annual Increase
Under 20	10.10%	8.98%
20 – 25	5.31%	8.37%
25 – 30	4.73%	8.40%
30 – 35	4.29%	7.28%
35 – 40	4.46%	6.90%
40 – 45	4.12%	6.30%
45 – 50	3.78%	6.04%
50 – 55	3.34%	5.64%
55 – 60	3.06%	5.45%
60 – 65	2.34%	5.39%
65 – 70	2.16%	5.61%

Below is a summary of the observed and assumed average annual salary increase for all participants during both the select and ultimate periods.

	1	2
Service	Observed Average Annual Increase	Assumed Average Annual Increase
1 – 2	4.54%	8.26%
2 – 3	4.87%	7.94%
3 – 4	4.74%	7.60%
4 – 5	4.23%	7.27%
5 – 6	4.01%	6.94%
6 – 7	4.20%	6.61%
7 – 8	3.75%	6.27%
8 – 9	3.66%	5.94%
Ultimate	3.31%	5.45%

II. ECONOMIC ASSUMPTIONS (continued)

C. Salary Increase Assumption (continued)

We recommend decreasing the length of the select period of the salary scale from ten years to five years, and that further study be given to the overall salary increase assumptions.

We will closely monitor the experience in the upcoming actuarial valuations. When a trend of excessive gains or losses is apparent, we will alert the Association to these results.

II. ECONOMIC ASSUMPTIONS (continued)

D. Payroll Growth Assumption

Unlike the other economic assumptions, the payroll growth assumption plays no part in the calculation of the Fund's liabilities. It does, however, have a material impact upon the determination of the amortization of the unfunded actuarial accrued liability and the determination of contribution rates. Under the current funding method, the amortization of the unfunded actuarial accrued liability over the funding period is calculated to be level as a percent of payroll. This calculation requires an assumption of the future annual increase in total covered payroll over the funding period.

The average of the total active member payroll of the Fund has increased 3.62% annually since 1997. The average annual increase in the number of active members is 0.49% per year. This experience study shows that historically the payroll growth experience has been lower than assumed, but similar to other economic assumptions we recommend this assumption to be a part of the broader economic forecast study.

III. DEMOGRAPHIC ASSUMPTIONS

The assumptions discussed in this section are demographic in nature, and rely heavily on the experience data and its credibility. The actuary often uses professional judgment in applying a level of credibility to experience data.

A primary analysis tool used in measuring the effectiveness of demographic assumptions is the actual to-expected ratio, or A/E ratio. This ratio is the number of actual occurrences divided by the assumed number of occurrences. An A/E ratio greater than 100% results from more actual occurrences than assumed, and an A/E ratio less than 100% results from less actual occurrences than assumed. An A/E ratio of 100% is not always the most desired result. For example, the trend of decreasing mortality rates is well documented, therefore the recommended mortality assumption should reflect the current mortality rates from the data with a margin to appropriately account for the expected trend of mortality improvement. Thus, an A/E ratio greater than 100% is typically desired for the recommended assumption.

A. Withdrawal Rates

The withdrawal rates used in actuarial valuations project the percentage of employees who are expected to terminate employment each year before the first assumed retirement age.

Current Actuarial Assumptions

The current assumption utilizes a “select and ultimate” approach. The select rates are used to reflect the consistency of withdrawal rates among employees with the same years of service regardless of their age. After the three-year select period, age-related rates are used to approximate the employees’ withdrawal rates.

III. DEMOGRAPHIC ASSUMPTIONS (continued)

A. Withdrawal Rates (continued)

The select withdrawal rates used for the July 1, 2004 actuarial valuation for the first three years of service are shown below:

Service	Male	Female
0 - 1	40.00%	40.00%
1 - 2	15.00%	15.00%
2 - 3	10.00%	10.00%

The ultimate withdrawal rates used for the July 1, 2004 actuarial valuation are shown below for selected ages:

Age	Male	Female
20	8.40%	8.40%
25	6.90%	6.90%
30	5.40%	5.40%
35	3.90%	4.20%
40	3.00%	3.50%
45	2.50%	3.00%
50	2.00%	2.50%
55	0.00%	0.00%

III. DEMOGRAPHIC ASSUMPTIONS (continued)

A. Withdrawal Rates (continued)

Membership Experience

A member withdraws from active employment when a termination from employment occurs prior to attaining the eligibility requirement for a retirement benefit. The current assumption utilizes an approach that accounts for a change in withdrawal rates at varying ages of employees with more than three years of service. It is reflected in the experience data that the change in these rates are more correlated to the change in years of service. It is apparent that after a certain “select” period, the rates of withdrawal for employees vary within a small range which can be approximated with a single “ultimate” rate.

III. DEMOGRAPHIC ASSUMPTIONS (continued)

A. Withdrawal Rates (continued)

The tables below summarize the total number of withdrawals during the select period, the actual average number per year and the expected average number per year based on the assumed withdrawal rates for male and female participants.

Male

Years of Service	Number of Withdrawals Fiscal Year Ended June 30				Average Per Year		
	2001	2002	2003	2004	Actual	Expected	Ratio
0 – 1	1,862	3,381	2,857	2,726	2,707	2,456	1.10
1 – 2	116	334	333	342	281	467	0.60
2 – 3	126	204	194	208	183	211	0.87
Total	2,104	3,919	3,384	3,276	3,171	3,134	1.01

Female

Years of Service	Number of Withdrawals Fiscal Year Ended June 30				Average Per Year		
	2001	2002	2003	2004	Actual	Expected	Ratio
0 – 1	3,641	7,274	6,063	5,804	5,696	4,889	1.17
1 – 2	419	969	967	919	819	1,106	0.74
2 – 3	348	674	579	698	575	476	1.21
Total	4,408	8,917	7,609	7,421	7,090	6,471	1.10

III. DEMOGRAPHIC ASSUMPTIONS (continued)

A. Withdrawal Rates (continued)

The tables below summarize the actual, expected, and recommended select withdrawal rates for male and female participants:

Male

Years of Service	Actual	Expected	Ratio	Recommended
0 – 1	44%	40%	1.10	40%
1 – 2	9%	15%	0.60	15%
2 – 3	9%	10%	0.87	10%

Female

Years of Service	Actual	Expected	Ratio	Recommended
0 – 1	47%	40%	1.17	40%
1 – 2	11%	15%	0.74	15%
2 – 3	12%	10%	1.21	10%

III. DEMOGRAPHIC ASSUMPTIONS (continued)

A. Withdrawal Rates (continued)

The tables below summarize the total number of individuals during the ultimate period, the actual average number per year and the expected average number per year based on the assumed withdrawal rates for male and female participants.

Male

Age Group	Number of Withdrawals Fiscal Year Ended June 30				Average Per Year		
	2001	2002	2003	2004	Actual	Expected	Ratio
20 – 25	2	10	2	8	6	9	0.67
25 – 30	29	60	47	55	48	52	0.92
30 – 35	82	106	99	106	98	96	1.02
35 – 40	95	157	106	86	111	108	1.03
40 – 45	145	180	139	136	150	142	1.06
45 – 50	133	161	143	147	146	142	1.03
50 – 55	121	144	146	131	136	114	1.19
Total	607	818	682	669	695	663	1.05

Female

Age Group	Number of Withdrawals Fiscal Year Ended June 30				Average Per Year		
	2001	2002	2003	2004	Actual	Expected	Ratio
20 – 25	7	14	19	21	15	17	0.88
25 – 30	98	121	97	128	111	101	1.10
30 – 35	175	273	237	251	234	188	1.24
35 – 40	264	383	272	324	311	252	1.23
40 – 45	356	557	404	460	444	365	1.22
45 – 50	389	573	464	523	487	381	1.28
50 – 55	308	443	428	432	403	287	1.40
Total	1,597	2,364	1,921	2,139	2,005	1,591	1.26

III. DEMOGRAPHIC ASSUMPTIONS (continued)

A. Withdrawal Rates (continued)

The tables below summarize the actual, expected, and recommended ultimate withdrawal rates for male and female participants for selected ages.

Male

Age Group	Actual	Average Expected	Ratio	Average Recommended
20 – 25	4.49%	7.42%	0.67	7.42%
25 – 30	5.64%	6.15%	0.92	6.15%
30 – 35	4.83%	4.74%	1.02	4.74%
35 – 40	3.47%	3.38%	1.03	3.38%
40 – 45	2.96%	2.79%	1.06	2.79%
45 – 50	2.36%	2.29%	1.03	2.29%
50 – 55	2.15%	1.81%	1.19	1.81%

Female

Age Group	Actual	Average Expected	Ratio	Average Recommended
20 – 25	6.85%	7.44%	0.88	7.44%
25 – 30	6.74%	6.14%	1.10	6.14%
30 – 35	6.00%	4.81%	1.24	4.81%
35 – 40	4.73%	3.83%	1.23	3.83%
40 – 45	4.00%	3.29%	1.22	3.29%
45 – 50	3.59%	2.80%	1.28	2.80%
50 – 55	3.25%	2.32%	1.40	2.32%

III. DEMOGRAPHIC ASSUMPTIONS (continued)

A. Withdrawal Rates (continued)

Findings and Recommendations

To develop the recommended rates of withdrawal, we first determined the exposure-weighted rate at service category for the ultimate assumption and each age for the select assumption. A graduation method is then used to smooth the variation in rates while capturing overall experience trend. We recommend the withdrawal assumption continue to utilize a select and ultimate approach.

The data reflects the assumed withdrawal rates in the select period reasonably well. Therefore, we recommend the continued use of the current assumed rates in the select period.

The complete tables of recommended withdrawal rates are shown in Appendix B. The actual/expected ratio of the recommended assumptions are as follows:

Select Period:

Male:	101.2%
Female:	109.5%

Ultimate Period:

Male:	104.7%
Female:	126.1%

III. DEMOGRAPHIC ASSUMPTIONS (continued)

B. Disability Incidence Rates

The rates of disability used in actuarial valuations project the percentage of employees who are expected to become disabled each year.

Current Actuarial Assumptions

The disability incidence rates used for the July 1, 2004 actuarial valuation are shown below for selected ages:

Age	Male	Female
20	0.01%	0.01%
25	0.01%	0.01%
30	0.02%	0.02%
35	0.05%	0.04%
40	0.09%	0.06%
45	0.14%	0.09%
50	0.23%	0.16%
55	0.49%	0.26%
60	0.82%	0.46%
65	0.00%	0.00%

III. DEMOGRAPHIC ASSUMPTIONS (continued)

B. Disability Incidence Rates (continued)

The tables below summarize the total number of disabilities in each age group, the actual average number and the expected average number based on the assumed disability incidence rates for male and female participants.

Male

Age Group	Number of Disabilities Fiscal Year Ended June 30				Average Per Year		
	2001	2002	2003	2004	Actual	Expected	Ratio

50 – 55	0.18%	0.20%	0.90	0.20%
55 – 60	0.42%	0.31%	1.37	0.31%
60 – 65	0.47%	0.56%	0.82	0.56%

III. DEMOGRAPHIC ASSUMPTIONS (continued)

B. Disability Incidence Rates (continued)

Findings and Recommendations

For active employees, actual experience shows disability incidence occurs with slightly less than expected frequency. The difference between actual and expected is not enough to warrant making any changes to the assumption. We therefore recommend no change to the current active disability incidence assumption.

The complete table of recommended disability incidence rates for regular and active employees is shown in Appendix C.

The actual/expected ratios of the recommended assumptions are as follows:

Males: 90.9%

Females: 97.6%

III. DEMOGRAPHIC ASSUMPTIONS (continued)

C. Retirement Rates

The rates of retirement used in actuarial valuations project the percentage of employees who are expected to retire each year.

Current Actuarial Assumptions

The retirement rates used for the July 1, 2004 actuarial valuation are shown below:

Age	Rule of 90 Eligible	Other
55	40%	7%
56	40%	7%
57	40%	7%
58	40%	7%

71	14%	100%	0.15	100%

III. DEMOGRAPHIC ASSUMPTIONS (continued)

C. Retirement Rates (continued)

Findings and Recommendations

For active employees, actual experience shows lower than expected rates of retirement under Rule of 90. For all other retirements, actual experience shows lower than expected rates of retirement at age 61 and higher than expected rates of retirement at age 62. Therefore, we recommend that the rates be adjusted to better match experience.

The complete table of recommended retirement rates for active employees are shown in Appendix D.

The actual/expected ratios of the recommended assumptions are as follows:

Rule of 90:	75.5%
Non-Rule of 90:	71.5%

III. DEMOGRAPHIC ASSUMPTIONS (continued)

D. Mortality Rates – Post-Retirement

The post-retirement mortality rates used in actuarial valuations project the percentage of beneficiaries and non-disabled retirees who are expected to die in the upcoming year.

Current Actuarial Assumptions

The mortality table for male beneficiaries and non-disabled retirees used for the July 1, 2004 actuarial valuation is the 1983 Group Annuity Mortality (GAM) Table for males, set back one year. The mortality table for female beneficiaries and non-disabled retirees is the 1983 Group Annuity Mortality (GAM) Table for females, set back one year. The mortality rates are shown below for selected ages:

Mortality Rates

Age	Male	Female
50	0.35%	0.15%
55	0.57%	0.23%
60	0.84%	0.38%
65	1.39%	0.64%
70	2.48%	1.09%
75	4.04%	2.11%
80	6.71%	3.85%
85	10.60%	6.38%
90	15.49%	10.14%
95	21.79%	16.51%
100	29.92%	26.82%

III. DEMOGRAPHIC ASSUMPTIONS (continued)

D. Mortality Rates – Post-Retirement (continued)

The tables below and on the next page summarize the total number of deaths in each age group, the actual average number and the expected average number based on the assumed mortality rates for male and female participants.

Male

Age Group	Number of Deaths Fiscal Year Ended June 30				Average Per Year		
	2001	2002	2003	2004	Actual	Expected	Ratio

80 – 85	3.89%	4.26%	0.91	4.26%
85 – 90	6.98%	6.89%	1.02	6.89%
90 – 95	14.01%	10.78%	1.30	10.78%
95 – 100	21.49%	17.30%	1.24	17.30%

III. DEMOGRAPHIC ASSUMPTIONS (continued)

D. Mortality Rates – Post-Retirement (continued)

Findings and Recommendations

Post-retirement experience was similar for males and females. The current mortality assumption overstated both male experience and female experience. The assumption projected lower mortality than was observed for both genders. Since mortality is expected to improve in the future, we do not recommend raising the mortality rates at this time. We recommend the continued use of the 1983 GAM table set back one year, since the table projects lower mortality rates than were observed.

This assumption reflects a margin for future mortality improvements. We will monitor future mortality experience of the entire membership group and recommend adjustments as necessary.

The complete tables of recommended mortality rates for non-disabled retirees are shown in Appendix E.

The actual/expected ratios of the recommended assumptions are as follows:

Males:	101.7%
Females:	103.6%

III. DEMOGRAPHIC ASSUMPTIONS (continued)

E. Mortality Rates – Pre-Retirement

The pre-retirement mortality rates used in actuarial valuations project the percentage of active employees who are expected to die during the upcoming year.

Current Actuarial Assumptions

The mortality table for active male employees currently used for the July 1, 2004 actuarial valuation is the 1983 Group Annuity Mortality Table for males, set back eight years. The Mortality Table for active female employees is the 1983 Group Annuity Mortality Table for females, set back seven years. The mortality rates are shown below for selected ages:

Mortality Rates

Age	Male	Female
20	0.03%	0.01%
25	0.03%	0.02%
30	0.04%	0.02%
35	0.05%	0.03%
40	0.07%	0.04%
45	0.10%	0.06%
50	0.15%	0.08%
55	0.28%	0.14%

III. DEMOGRAPHIC ASSUMPTIONS (continued)

E. Mortality Rates – Pre-Retirement (continued)

The tables below and on the next page summarize the total number of deaths in each age group, the actual average number and the expected average number based on the assumed death rates for male and female participants.

Male

Age Group	Number of Deaths Fiscal Year Ended June 30				Average Per Year

III. DEMOGRAPHIC ASSUMPTIONS (continued)

E. Mortality Rates – Pre-Retirement (continued)

The tables below and on the next page summarize the actual, expected, and recommended pre-retirement mortality rates for male and female participants for selected ages.

Male

Age Group	Actual	Average Expected	Ratio	Average Recommended
20 – 25	0.01%	0.03%	--	0.03%
25 – 30	0.03%	0.04%	1.00	0.04%
30 – 35	0.04%	0.05%	1.00	0.05%
35 – 40	0.05%	0.05%	1.00	0.05%
40 – 45	0.04%	0.08%	0.50	0.08%
45 – 50	0.14%	0.12%	1.22	0.12%
50 – 55	0.16%	0.19%	0.86	0.19%
55 – 60	0.28%	0.34%	0.82	0.34%
60 – 65	0.49%	0.55%	0.86	0.55%
65 – 70	0.73%	0.83%	0.88	0.83%
70 – 75	0.66%	0.69%	1.00	0.69%

III. DEMOGRAPHIC ASSUMPTIONS (continued)

E. Mortality Rates – Pre-Retirement (continued)

Female

Age Group	Actual	Average Expected	Ratio	Average Recommended
20 – 25	0.03%	0.02%	1.00	0.02%
25 – 30	0.02%	0.01%	1.00	0.01%
30 – 35	0.03%	0.03%	1.50	0.03%
35 – 40	0.02%	0.03%	0.67	0.03%
40 – 45	0.04%	0.04%	0.86	0.04%
45 – 50	0.06%	0.07%	0.85	0.07%
50 – 55	0.10%	0.10%	1.07	0.10%
55 – 60	0.19%	0.16%	1.27	0.16%
60 – 65	0.30%	0.24%	1.25	0.24%
65 – 70	0.36%	0.41%	--	0.41%
70 – 75	0.39%	0.30%	--	0.30%

III. DEMOGRAPHIC ASSUMPTIONS (continued)

E. Mortality Rates – Pre-Retirement (continued)

Findings and Recommendations

Pre-retirement experience was different on a gender basis. The current mortality assumption overstated male experience and understated female experience. However, the differences were not large enough to warrant changing the mortality rates at this time. We recommend the continued use of the 1983 GAM table set back eight years for males and set back seven years for females.

The complete tables of recommended mortality rates for pre-retirement employees are shown in Appendix F.

III. DEMOGRAPHIC ASSUMPTIONS (continued)

F. Mortality Rates – Disabled

The disabled mortality rates used in actuarial valuations project the percentage of disabled retirees who are expected to die in the upcoming year. Mortality for disabled retirees is expected to be higher than mortality for non-disabled retirees.

Current Actuarial Assumptions

The mortality table for disabled retirees currently used for the July 1, 2004 actuarial valuation is the 1965 Railroad Retirement Board rates through age 54. For ages 55 through 64, graded rates between the 1965 Railroad Retirement Board and the healthy post-retirement table are used. For ages 65 and later, the healthy post-retirement table is used. The mortality rates are shown below for selected ages:

Age	Males	Females
35	4.41%	4.41%
40	4.41%	4.41%
45	4.48%	4.48%
50	4.86%	4.86%
55	5.44%	5.41%
60	3.75%	3.51%
65	1.39%	0.64%
70	2.48%	1.09%
75	4.04%	2.11%
80	6.71%	3.85%
85	10.60%	6.38%
90	15.49%	10.14%
95	21.79%	16.51%

III. DEMOGRAPHIC ASSUMPTIONS (continued)

F. Mortality Rates – Disabled (continued)

The tables below and on the next page summarize the total number of disabled deaths in each age group, the actual average number and the expected number based on the assumed disability mortality rates for male and female participants.

Male

Age Group	Number of Disabled Deaths Fiscal Year Ended June 30				Average Per Year		
	2001	2002	2003	2004	Actual	Expected	Ratio
35 – 39	0	0	0	1	0	0	--
40 – 45	1	2	2	0	1	1	1.00
45 – 50	3	1	1	0	1	3	0.33
50 – 55	5	3	1	3	3	7	0.43
55 – 60	6	8	4	4	6	11	0.55
60 – 65	11	6	12	7	9	8	1.13
65 – 70	4	2	4	2	3	1	3.00
Total	30	22	24	17	23	31	0.74

III. DEMOGRAPHIC ASSUMPTIONS (continued)

F. Mortality Rates – Disabled (continued)

Female

Age Group	Number of Disabled Deaths Fiscal Year Ended June 30				Average Per Year		
	2001	2002	2003	2004	Actual	Expected	Ratio
35 - 39	1	0	1	0	1	1	1.00
40 - 45	1	0	0	1	1	2	0.50
45 - 50	9	1	1	1	3	5	0.60
50 - 55	5	4	8	4	5	9	0.56
55 - 60	13	7	11	8	10	12	0.83
60 - 65	7	6	9	12	9	9	1.00
65 - 70	3	2	0	2	2	1	2.00
Total	39	20	30	28	29	39	0.74

III. DEMOGRAPHIC ASSUMPTIONS (continued)

F. Mortality Rates – Disabled (continued)

The tables below summarize the actual, expected, and recommended pre-retirement mortality rates for male and female participants for selected ages.

Male

Age Group	Actual	Average Expected	Ratio	Average Recommended
35 – 40	4.76%	4.41%	--	0.09%
40 – 45	4.95%	4.42%	1.00	0.13%
45 – 50	1.81%	4.56%	0.33	0.23%
50 – 55	2.16%	5.08%	0.43	0.40%
55 – 60	2.53%	5.11%	0.55	0.61%
60 – 65	3.66%	3.26%	1.13	0.93%
65 – 70	3.74%	1.73%	3.00	1.30%

Female

Age Group	Actual	Average Expected	Ratio	Average Recommended
35 – 40	4.26%	4.41%	1.00	0.05%
40 – 45	1.12%	4.42%	0.50	0.07%
45 – 50	2.56%	4.55%	0.60	0.10%
50 – 55	2.98%	5.05%	0.56	0.17%
55 – 60	4.02%	4.97%	0.83	0.26%
60 – 65	2.72%	3.01%	1.00	0.42%
65 – 70	2.11%	1.05%	2.00	0.60%

III. DEMOGRAPHIC ASSUMPTIONS (continued)

F. Mortality Rates – Disabled (continued)

Findings and Recommendations

For active employees, actual experience shows disabled mortality occurs with less than expected frequency. However, exposure on this assumption is very low, so we recommend no change to this assumption.

III. DEMOGRAPHIC ASSUMPTIONS (continued)

G. Percent Married

Current Actuarial Assumptions

85% of male members and 65% of female members are assumed to be married.

Findings and Recommendations

The current assumption remains reasonable.

H. Presence and Age of Beneficiary

Current Actuarial Assumptions

Females are assumed to be four years younger than males.

Findings and Recommendations

On average, experience data has shown current male retirees are 3.06 years older than their female spouses, and that female retirees are 1.82 years younger than their male spouses. Therefore, the current assumption remains reasonable.

I. Optional Form of Annuity

Current Actuarial Assumptions

For male retirees, 10% are assumed to elect a 25% Joint and Survivor annuity, 20% are assumed to elect a 50% Joint and Survivor annuity, 10% are assumed to elect a 75% Joint and Survivor annuity, and 30% are assumed to elect a 100% Joint and Survivor annuity. For female retirees, 5% are assumed to elect a 25% Joint and Survivor annuity, 5% are assumed to elect a 50% Joint and Survivor annuity, 5% are assumed to elect a 75% Joint and Survivor annuity, and 15% are assumed to elect a 100% Joint and Survivor annuity.

Findings and Recommendations

The current assumption remains reasonable.

IV. ACTUARIAL COST METHODS

Actuarial Cost Method

The actuarial cost method is the procedure used to allocate the cost of the plan among different plan years. A portion of the value of benefits is attributable to past service (actuarial accrued liability) and the remainder (the present value of future normal costs) is attributable to future service. Recent actuarial valuations have been based on the actuarial cost method known as the Entry Age Normal Actuarial Cost Method. This method produces costs that remain relatively level as a percentage of covered payroll. Under the Entry Age Normal Cost Method, the total contribution requirement has two components - an annual normal cost, and a payment with respect to the unfunded actuarial accrued liability. The annual normal cost is calculated for each active employee as the level percentage of pay required over the employee's period of assumed employment to pay the total expected benefits. If actuarial assumptions are met, the total normal cost rate will remain level as a percentage of payroll.

The actuarial accrued liability is the present value of benefits allocated to years prior to the valuation date. It reflects the average liability allocated for past service when the plan was established, as well as adjustments for plan amendments, changes in assumptions, and experience gains and losses. The unfunded actuarial accrued liability is the amount of the accrued liability in excess of the actuarial value of assets. It is paid (amortized) in installments over a period of years, *i.e.* the funding period.

Approximately 75% of large public retirement systems use the Entry Age Normal Cost Method. We recommend that the use of the current actuarial cost method be continued.

Actuarial Asset Valuation Method

The purpose of an actuarial asset valuation method is to smooth the normal volatility of the economic markets and dampen the effect this volatility has on determining the Association's statutory rates. The current actuarial asset valuation method under the non-MPRIF Reserves is a reasonable approach. The actuarial value of assets are valued under a smoothing method which recognizes the gains and losses gradually over five years.

IV. ACTUARIAL COST METHODS

Actuarial Asset Valuation Method (continued)

The total market value of assets provided for the valuation is equal to the sum of the non-MPRIF assets and MPRIF reserve, the MPRIF reserve is a “true-up” each year to equal the MPRIF liabilities as of the valuation date, and does not reflect the actual MPRIF market value of assets as of that date. Therefore, the total “market value of assets” is adjusted each year to account for the change in reserves under MPRIF, and balances out in the non-MPRIF assets as either a gain or loss. Hence, the “market value of assets” used to determine contribution rates and funded ratios contains amounts that do not exist as an asset. In GASB language, this implies that a portion of the assets are “liability” related, and not fully “market-related”.

To comply with GASB, the actuarial value of assets are required to be used in the calculation of the funded ratios, and should be market related. The non-MPRIF asset smoothing method is market related and complies with GASB. However, we recommend a review of this asset method for the Post-Retirement Fund by the auditors to ensure it is GASB compliant.

Amortization Schedule

The current amortization schedule under the Association is defined as a closed amortization period ending July 1, 2031, for years when there exists a positive Unfunded Actuarial Accrued Liability (UAAL). During the years where there is a negative UAAL, the surplus amount is amortized over 30 years as a level percentage of payroll.

This schedule creates volatility in the actuarial required contribution. Since gains and losses are amortized over a steadily decreasing (closed) period, this method can result in highly variable contributions rates from year to year. As the amortization period approaches zero, the more variable the rate becomes (For example, a loss in 2030 would have to be paid off in one year).

We recommend the Association undertake a more comprehensive “amortization method” study to select an amortization method that satisfies a requirement of paying off the UAAL within a reasonable period of time and reduces volatility in the rate. Reducing rate volatility will help with budget and planning, while still satisfying the funding requirements of the Association.

APPENDIX A

SUMMARY OF PROPOSED RECOMMENDATIONS

<u>Assumption/Method</u>	<u>July 1, 2004 Actuarial Valuation</u>	<u>Recommended in 2005 Experience Study</u>
Inflation	4.00% to 4.50% per annum	Conduct broader study with SBI
Investment Return	8.50% per annum, net of investment expenses	Conduct broader study with SBI
Salary Increases	Age and service based rates with ten-year select period	Conduct broader study with SBI
Payroll Growth	5.00% per annum	Conduct broader study with SBI
Withdrawal	Age and service based rates with three-year select period	No change
Disability Incidence	Age based rates	No change
Retirement	Age based rates for Rule of 90 and for all other retirements	Lower Rule of 90 rates from ages 55 to 61 and 63-64; change all other retirement rates at ages 61-62
Post-Retirement Mortality	1983 GAM Table for regular members set back one year for males and one year for females	No change
Pre-Retirement Mortality	1983 GAM Table for regular employees set back eight years for males and seven years for females	No change

APPENDIX A

SUMMARY OF PROPOSED RECOMMENDATIONS (continued)

<u>Assumption/Method</u>	<u>July 1, 2004 Actuarial Valuation</u>	<u>Recommended in 2005 Experience Study</u>
Disabled Mortality	1965 Railroad Retirement Board Disabled Life Mortality Table through age 54, graded to healthy post-retirement mortality at age 65	No change
Beneficiary Mortality	1983 GAM Table for regular beneficiaries set back one year for males and one year for females	No change
Dependent Children	No dependent children are assumed	No change
Marital Status	85% of male members and 65% of female members are assumed to be married	No change
Spouse Age	Females are assumed to be four years younger	No change
Optional form election	Joint and Survivor annuities elected at gender-based rates	No change
Actuarial Cost Method	Entry Age Normal	No change
Asset Valuation Method	Five-year smoothing Method under only the non-MPRIF reserves	Recommend review by auditors to determine GASB compliance
Amortization Method	Closed amortization period; 27 years as of July 1, 2004	Recommend ongoing review and broader study with the Association
